Learner Data Processing Application

This Application processes learner submissions for a given course, calculating average scores and providing detailed assignment performance in an array format

The Main Features:

- **Data Input**: Accepts course information, assignment groups, and learner submissions.

- **Score Calculation**: Computes average scores for each learner and stores individual assignment performances.

- **Error Handling**: Includes error handling using ty and catch and provide informative error messages.

The Application provides;

1. Provide course details (CourseInfo).

2. Define assignment groups (AssignmentGroup).

3. Input learner submissions (LearnerSubmissions).

4. Run the getLearnerData function to generate organized results.

Output:

- The output includes an array of objects containing learner IDs, average scores, and detailed assignment scores.

More can be done with this application if I can make necessary edits to meet the user needs.
